SYNTHETIC CLINICAL STUDY PROTOCOL

SYNTHETIC DEMO DOCUMENT - FOR SOFTWARE TESTING/HACKATHON USE ONLY - NOT IRB APPROVED

Remote Monitoring After Heart Failure Hospitalization With the HF-Connect Program

Protocol ID: HFC-RM-02 **Study ID:** STUDY-008

Protocol version	1.0
Sponsor	Harborline Cardiology Network (synthetic)
Phase	Not Applicable
Condition	Heart Failure
Design	Randomized, open-label, remote device-enabled study
Target enrollment	160
Duration	12 weeks
Primary objective	Heart failure readmission or emergency visit by Week 12

1. Study Synopsis

This synthetic protocol evaluates HF-Connect in participants with Heart Failure. The study uses a randomized, open-label, remote device-enabled study design and plans to enroll approximately 160 participants across multiple sites.

2. Objectives and Endpoints

Primary endpoint: Heart failure readmission or emergency visit by Week 12. Secondary objectives include participant safety, adherence, feasibility of remote data collection, and descriptive changes in study-specific patient-reported measures.

3. Study Arms

HF-Connect remote monitoring; Standard discharge follow-up.

4. Inclusion Criteria

- Age 40-85 years
- Hospitalized for heart failure within the past 14 days
- Home internet or cellular access
- Able to stand on the study scale

5. Exclusion Criteria

- Planned cardiac surgery within 12 weeks
- Enrolled in hospice care

6. Study Procedures

Participants complete screening, informed consent, baseline assessments, scheduled study visits, and remote or site-based assessments according to the Schedule of Activities. Patient-reported measures may be collected through a secure messaging interface or linked web form.

7. Study Measurements

- Body weight: Daily (Connected device)
- Shortness of breath at rest: Daily (Patient message)
- Ankle swelling: Daily (Patient message)
- Daily steps: Daily (Connected device)
- NT-proBNP: Weeks 0,6,12 (Site laboratory)

8. Safety Monitoring

Study staff review predefined safety and completeness signals. Automated software may flag missing or unusual values for human review but does not independently make medical decisions.

9. Data Management

Each participant is assigned a study-specific participant ID. Identifiable contact information is stored separately from the analysis dataset. Source responses, parsed values, timestamps, document versions, and audit events are retained.

10. Statistical Overview

The primary analysis will summarize the primary endpoint according to the prespecified analysis population. Descriptive statistics will be used for adherence, missingness, participant-reported measures, and operational monitoring.
